An AI that never writes a word.

It comes from a co-inventor of RLHF, the training method behind ChatGPT. And it might be the missing piece in your Salesforce org.

“We’re building prod, not God.”

99% of AI interactions will be machine to machine, and only 1% human.

TYPESAFE’S BET · AI PRIMER

It doesn’t answer. It decides.

LLM	Writes text for a person to read. Great in a chat window, awkward for code to branch on.
SYSTEM ONE MODEL	Returns a typed decision with probabilities. Your code reads it and acts.

NAMED AFTER KAHNEMAN’S SYSTEM 1: FAST AND INTUITIVE, NOT SLOW AND DELIBERATE

A third way to train a model.

RLHF	Taught models to chat by rewarding what people prefer.
RLVR	Taught models to reason. Strong, but slower and pricier.
RLCD	Trains calibrated decisions. No text, just an answer and how sure it is.

RLHF WAS CO-INVENTED BY DIOGO ALMEIDA, TYPESAFE CO-FOUNDER

“I don’t know” is a feature.

0.8

should be right about 80% of the time,
measured across many answers.

THAT’S HOW CODE KNOWS WHEN TO ACT AND WHEN TO ASK A HUMAN

Three ways to ask.

CHOICE	Which team should own this case?	Billing
SCORE	How frustrated is the guest? (0 to 3)	2.06
NOUL	Did they ask for a refund?	0.98

REAL ANSWERS · “CHARGED TWICE FOR SPA PACKAGE” · JEV-1.13.0

One call. Five answers.

```
"department":       { "choice": "Billing", "confidence": 1.0  }
"refund_requested": { "noul": 0.98 }
"urgency":          { "noul": 0.83 }
"frustration":      { "score": 2.06, "confidence": 0.94 }
"churn_risk":       { "score": 2.86, "confidence": 0.86 }
```

TRIMMED RESPONSE · POST /V1/SYSTEMONE · NOULS CARRY NO CONFIDENCE

What TypeSafe's cookbooks show.

12×	cheaper, asking 13 questions in a single call.
5% → 18%	top-1 accuracy, re-ranking legal search results.
182 → 1	picking the right skill for an agent's next turn.

ALSO ON THEIR MAP: MODERATION, INSURANCE CLAIMS, FINANCIAL CRIME, SUPPORT

Apex already branches on bits.

"Imagine if they could also branch on common sense."

CASE TRIAGE	Case → Jev → typed fields → Flow → queue
AGENTFORCE	Message → Jev → pass · review · block · support

QUOTE: TYPESAFE MANIFESTO · JEV IS THE JUDGMENT LAYER, NOT THE AGENT

Three guests. One call each.

“Villa AC not working…”

“Charged twice for spa package…”

“Move dinner reservation…”

Same card number. Two answers.

IN “My card number is 4111 1111 1111 1111…”

OUT “The account holder is… card 4111 1111 1111 1111”

One says review. The other says block.

No pass, no tool.

“The Wi-Fi in villa 7 keeps dropping…”

“Please charge the late checkout fee to my card…”

“I booked this retreat to get away from everything…”

Salesforce got there first.

3 → 1

risky messages, one canned reply.
Including the guest in crisis.

PLATFORM CLASSIFIER RAN FIRST · JEV NEVER SAW THEM

What we measured.

209 ms	typical call from inside the org, measured on instance NA232.
8 / 8	guardrail decisions correct at the action level.
69	Apex tests passing, after three real bugs.

BUGS: HEADER FORMULAS, VANISHING CASES, PICKLIST VS RECORD TYPES

The judgment, not the agent.

FITS	Narrow, repeatable judgments your code branches on, in about 200 ms.
DOESN’T	Anything whose output is a paragraph. And India data residency isn’t documented yet.
